ANTI-SMOG CERTIFICATION OF DISTRICT HEATING SYSTEMS

Air quality is our priority

In 2016, our institute developed its own system for assessing and certifying buildings, heating systems and appliances as well as road vehicles, including passenger cars, for emissions of pollutants emitted into the air. Jest to pierwsza i jedyna tego typu metoda oceny na świecie. It is the first and only evaluation method of its kind in the world.

'PreQurs' certificates and the 'NO SMOG' building labelling scheme are a friendly way of communicating between people to facilitate understanding of suppliers and consumers of different heat generation and building heating technologies.

The developed system of certification and labelling of buildings has greatly helped to understand the advantages of district heating supplied by district heating plants and combined heat and power plants to buildings over individual heat sources. In Poland, more than 60 district heat suppliers are covered by the certification programme.

Anti-smog certification has also attracted the attention of numerous manufacturers, distributors and suppliers of heating equipment on the Polish market. The 'PreQurs' and 'NO SMOG PLUS' certificates have gained particular recognition in the combined heat pump and photovoltaic industry, demonstrating to their users the beneficial effects on ambient air quality and the global environment.

As part of its meetings and seminars, the ICEB also conducts educational activities.

We welcome your cooperation
